

WebApp for Lost and Found items at Airport

Abstract

The idea behind this project is to help people who loss their items at airport.

Operations that will be performed under this project: A homepage where a normal user will apply some filters and get the details of lost item similar to his/her filters. A login page for admin user. After authentication he or she can perform various tasks related to items. A Dashboard for Admin user where the user will upload new lost items found at airport and do other manipulations on existing items. There will be a contact page, user will find the contact details of the person who is taking care of lost and found things and will help him to get his item back. Moreover there will be a feedback page where a user can provide his/her feedback based on experience. The creation of admin user will be taken cared by webapp admin only. Only Admin user will have access to login in the site and manipulation of items.

HTML will be used for layout of page and css, Bootstrap will be used for styling. Javascript will be there for behavioural things. Backend will be developed using nodjs. We are going to use MySql for databse. Git will be used for version control.
